It can copy, scan, and print 11" x 17" sheets at speeds up to 30 pages per minute. A USB socket on the front allows for direct printing and scanning from a USB flash drive without the need for a computer. A person can scan or copy directly on the multifunction, while other functions are being done via the network. An USB access port on the front allows copies or scans directly from a USB Flash drive eliminating the need to connect to a computer.

The 200-sheet bypass tray can support paper weights from 12 to 100 pounds. Adding additional paper trays and drawers will increase the total capacity of this model up to 2,200 sheets. If paper is low or out in one drawer, the CS300i lets you add paper while it's still running jobs. This will give you data encryption and security overwriting for "deleted" files. After a 29-second warmup, each print or copy job only takes around 5 seconds to start. The maximum image resolution is 600 x 600 dpi, which does a decent job with letters and but may appear a little coarse for finer CAD drawings and graphics. The duplexer comes standard, giving you the choice of 2-sided printing. The Reversing Automatic Document Feeder RADF is an optional feature and can scan sizes up to 11" x 17" at speeds up to 50 images per minute. Zoom ranges from 25% to 400% with a choice of 1% increments, automatic resizing, or using 10 preset "jumps". Up to 999 copies can be reproduced. Images can be saved as JPEG, XPS, TIFF, and PDF formats. The scanned images can be exported to a network directory, email, USB drive, or on the internal hard drive. I don't know of a company that would buy a midrange copier/printer without an ADF. While more businesses will accept documentation via

email, there are still companies out there that won't accept certain legal documents unless they're transmitted by fax. Just remember that for anything beyond a business letter, the actual toner usage per page is going to be much more, reducing the number of pages you can get out of a cartridge. The separate drum unit of the CS300i will need to be replaced about every 300,000 pages, which is the same time it will be ready for the maintenance kit and service. It also indicates whether each printer model is likely to work when printing from the IBM System i products using LPR, PDL, SNMP, IPP, or a PC5250 printer session. IBM support does not actively search for information about new or different printers. This document is updated on an as needed basis. Refer to the printer hardware documentation or visit the printer manufacturers website to locate the printers specifications to make the determination if it will work with the IBM i. What specifications to look for Emulation or Printer Languages, or search on PCL. Or, create a printer configuration and see if it works. It also indicates whether each printer model is likely to work when printing from a System i using LPR, PDL, SNMP, IPP, or a PC5250 printer session. In some cases, information on a particular printer model is based solely on what has been shown to work with other similar printer models. Note Therefore, there are no guarantees that the information on any particular printer model is correct. If you are looking for information on a printer model that is not listed in this document, please refer to your printer manuals, search on the manufacturer Web site, contact the manufacturer directly to determine what printer data streams are supported on the printer, or look at the information listed for similar printer models. Note In many cases, this document will list similar printer models that support the same printer data streams.

This can be an indication of how well the new printer model will work with a System i using LPR, PJP, SNMP, IPP, or a PC5250 printer session. We will do what we can to help determine how best to print to your printer from your System i. Furthermore, the printer might need to be in a particular emulation mode to work well with the System i. It is recommended that you first determine the current emulation mode for the printer and then look through the list to determine the printer capabilities and the MFRTYPMDL for HPT or the PDT File for PC5250 setting that is needed. For best results, these printers should be in IBM or Epson emulation mode, if possible. However, the supported emulation modes will still determine the printer capabilities and the MFRTYPMDL for HPT or PDT File for PC5250 setting that is needed. For best results, these printers should support HP PCL3, HP PCL5, HP PCL6, or IBM PPDS, if possible. It is generally recommended to use PJP or SNMP whenever possible. However, using LPR, IPP, or a PC5250 or thirdparty printer session are also viable options. However, you should still have the option of using Host Print Transform HPT. This printer language supports printing in Windows 98SE, Windows ME, Microsoft Windows NT 4.0, Windows 2000 and Windows XP, but does not support printing in Microsoft MSDOS. Therefore, printers that use this printer data stream will not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT File. PostScript was developed by Adobe, but is used by a number of other printer manufacturers, though typically in laser printers. A number of manufacturers have their own versions of PostScript level 2 and PostScript level 3, and KPDL2 and KPDL3 are what Kyocera Mita calls their versions. PRESCRIBE is operating system independent, so forms created in a Microsoft Windows application can be used from Linux, mainframe, or any other operating system. Click on the arrow in front of any section to read the explanation.

The headings are Printers, Printer Data Stream, HostBased or Windows Only, PDT File for PC5250, MFRTYPMDL for HPT, LPR, PJI, SNMP, and IPP. Printers The Printers column contains the name of each printer, or printer series. The printers are grouped by type of printer for example, laser printers, color laser printers, ink jet printers, dot matrix and line printers, and multifunction printers and are generally listed in ascending order. An attempt is made to have an entry for each ASCII printer from a particular manufacturer, whether they are currently marketed by that manufacturer or not. Printer Data Stream The Printer Data Stream column lists the printer data streams supported by each particular printer. Support for these can differ depending on the data stream. Some popular printer data streams include Printers that use this printer data stream will work with Host Print Transform HPT and might work with a PC5250 Printer Definition Table PDT file. EPL2 is a text based language that uses all keyboard accessible characters to communicate with all other Eltron label printers. These printer languages are not supported by Host Print Transform HPT, but HPT should pass the EPL1 data streams to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST. It is unknown at this time whether HPT will pass the EPL2 data stream to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST. This printer language is not supported by Host Print Transform HPT, but HPT should pass the EPL data stream to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST. It is used primarily in dot matrix line printers, but it is also used in a number of ink jet printers. PPDS was development by IBM and was used in older IBM and Lexmark laser printers.

IBM PPR was developed by IBM, but it is used by a number of other printer manufacturers. It is used primarily in dot matrix line printers, but it is also used in a number of ink jet printers. The XL designates widecarriage printers, the II and III designate upgrades to the Proprinter data stream, and the 24 refers to the Proprinter data stream used for 24pin printers. Because these printers require a proprietary printer data stream, they will not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT File. Note Configuring a PC5250 printer session without Host Print Transform HPT and without a Printer Definition Table PDT file is most likely to print successfully. Therefore, configuring to print to a HostBased Printing, Proprietary GDI, or Windows GDI printer is considered unsupported, as would printing to any other hostbased printer. PCL was developed by HewlettPackard HP, but it is used by a number of other printer manufacturers including IBM Printing Systems and Lexmark. PCL was developed by HewlettPackard HP, but it is used by a number of other printer manufacturers including IBM Printing Systems and Lexmark. PostScript was developed by Adobe, but is used by a number of other printer manufacturers, though typically in laser printers. The PostScript printer data stream will not work with Host Print

Therefore, printers that use this printer data stream will not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT file. XML is textbased, but it is unknown at this time whether Host Print Transform HPT will pass the XML data stream to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST.

According to the W3C, XHTML is designed to be appropriate for printing from mobile devices to lowcost printers that might not have a fullpage buffer and that generally print from toptobottom and lefttoright with the paper in a portrait orientation. XHTMLPrint is also targeted at printing in environments where it is not feasible or desirable to install a printerspecific driver and where some variability in the formatting of the output is acceptable. XHTML will not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT File. It is an XMLbased or XAMLbased specification, based on a new print path and a colormanged vectorbased document format which supports device independence and resolution independence. XML Paper Specification, or XPS, will not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT file. These printer languages are not supported by Host Print Transform HPT, but HPT should pass the ZPL and ZPL II data streams to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST. This printer language is not supported by Host Print Transform HPT, but HPT should pass the ZPL data stream to the printer untouched when configured to use the QWPDEFAULT systemsupplied Workstation Customizing Object WSCST. HostBased or Windows Only The HostBased column formerly called the Windows Only column shows if a specific printer is a hostbased printer. The term Windows Only printer means that the printer was designed to be used only on a PC running a version of Microsoft Windows and was also generally designed to be used in a home or small office environment rather than in a networking environment. The term hostbased printer expands this to refer to any printer that relies on the processing power of the host computer to generate printable pages; for example, if the host computer is running one of the versions of Microsoft Windows, Linux, or Macintosh operating system.

The term Windows Only printer is becoming somewhat obsolete because newer printers that fit this category often come with printer software and printer drivers that allow them to be used on Apple Macintosh computers and PCs running one or more versions of the Linux operating system. However, the term Windows Only printer will often continue to be used to describe hostbased printers. Because they rely on the processing power of the host computer, hostbased printers do not need a powerful processor of their own and, therefore, they tend to be less expensive than conventional printers. However, because they share the computers processor, they might be slow and might slow down other tasks running on the computer. Because they use a proprietary printer data stream, they do not work with Host Print Transform HPT or a PC5250 Printer Definition Table PDT file. The only way to get a hostbased printer to print IBM i family spooled files is to attached it to a host computer and then use printer emulation software, such as a PC5250 printer session, to print the spooled file through the hostbased printer driver. PDT File for PC5250 The PDT File for PC5250 column lists the name of a Printer Definition Table PDT File that can be used when configuring a Personal Communications 5250 or PC5250 printer session. Personal Communications 5250 PC5250 started shipping new PDT files starting in V5R3M0 IBM iSeries Access for Windows. PDT files listed in lowercase characters are shipped with V5R3M0 iSeries Access for Windows and above for example, hppcl5.pdt , while PDT files listed in UPPERCASE characters are shipped with V5R2M0 iSeries Access for Windows and below for example, HPLJ4.PDT .

For more information on PDT files, including a list of all PDT files available through iSeries Access for Windows, or to get the older PDT files on a PC running V5R3M0 iSeries Access for Windows or higher, please refer to the following document N1019626 List of Printer Definition Table PDT Files for Use with PC5250 For information on configuration and limitations of PC5250 printer sessions, with or without a PDT file, please refer to the following document N1018716 System i Access for Windows Configuring a PC5250 Printer Session MFRTYPMDL for HPT The MFRTYPMDL for HPT column lists the Manufacturer Type and Model MFRTYPMDL setting that can be used with Host Print Transform HPT to select the appropriate data stream for that printer. This special workstation customizing object causes Host Print Transform to send plain ASCII text without any printer controls, such as page size, LPI, CPI, font, print quality, and so on. Support for Remote Output Queues, as well as the SNDTCPSPLF and LPR commands, is largely dependent on the internal network interface card NIC or external print server used with the printer. Therefore, this column is as much of a statement about the NIC or print server typically shipped with the printer than it is about the printer itself. This field can have one of the following settingsPJJL allows for twoway communication with the printer when attached to the LAN using a print server that also supports bidirectional PJJL. Support for the PJJL print driver is largely dependent on the internal network interface card NIC or external print server used with the printer. If it is unclear whether the NIC, print server, or printer supports PJJL, contact the manufacturer. This field can have one of the following settingsSNMP allows for twoway communication with the printer when attached to the LAN using a print server that also supports SNMP.

Support for the SNMP print driver is largely dependent on the internal network interface card NIC or external print server used with the printer. If it is unclear whether the NIC, print server, or printer supports SNMP, contact the manufacturer. This field can have one of the following settingsThe term IPP refers to the Internet Print Protocol. IPP allows for twoway communication with the printer when attached to the LAN using a print server that also supports IPP. Support for the IPP Print Driver is largely dependent on the internal network interface card NIC or external print server used with the printer. Therefore, this column is as much of a statement about the network interface card NIC or print server typically shipped with the printer than it is about the printer itself. If it is unclear whether the NIC, print server, or printer supports IPP, contact the manufacturer. This field can have one of the following settingsThe printer data stream still may not be compatible with Host Print Transform HPT or a Printer Definition Table PDT file. However, when very little information is provided by the manufacturer it is often the case that the printer data stream is hostbased. Fast, reliable Kyocera copier repair and service.
